Note

* indicates that the Canon DSLR camera is recommended to take the camera in MF mode. If the camera is shot in AF mode, there will be a low probability of focus failure and jam.

If power supply setting is turned off in the Sony camera's internal settings but the gimbal still supplies power to the camera. Please switch the cable selection (Multi ↔ Multi/C) on the gimbal to switch whether or not to power the camera.

Both M3C-Micro cable or M3C-Multi/C cable, when connecting the camera, if it appears "please check the connected device". Please restart the stabilizer and reconnect it once again.

These three Sony models can achieve electronic focus: Alpha 7 III, Alpha 7R III, Alpha 6400，If you can't make electronic focus, you can try the lens to be in AF mode, but the camera needs to be set to MF mode.

**MCSC-C1, Micro to Type C adapter, M3C-Cp and M3C-LANC are optional, you can purchase those cables from https://store.gudsen.com/
